## Weather Journal App with Asynchronous JavaScript

This project requires you to create an asynchronous web app that uses Web API and user data to dynamically update the UI in a Weather Journal application.

Project Files

You can obtain the project code here. To complete the project will require modifying the `server.js` file and the `website/app.js` file. You can see `index.html` for element references, and once you are finished with the project steps, you can use `style.css` to style your application to customized perfection.

Rubric

Your project will be evaluated by a Udacity code reviewer according to the Weather-Journal project rubric. Please make sure to re-review the rubric for detailed project requirements prior to submission.

Submission

Once you've met all of the rubric requirements, you can submit your project as either a zip file or a Github repository link below.
